

Did you know that...

A humpback whale calf stays very close to its mother after birth. She teaches it how to swim, breathe at the surface, and navigate the vast ocean.
Baby whales grow very quickly. During their first months of life, they can gain dozens of kilograms every day to become strong enough for long ocean journeys.
The bond between a mother whale and her calf is very strong. Young whales often swim right beside or underneath their mothers, where they are better protected from danger.
Humpback whales are among the most famous whales in the world. They are known for their exceptionally long pectoral fins, which can grow almost as long as a car.
