Did you know that...

IQcoloring.com

Humpback whales are among the most famous whales in the world because of their spectacular jumps above the ocean surface.
Even though they can weigh many tons, they are able to launch much of their body out of the water.
Scientists are not completely sure why humpback whales breach. They may use these jumps to communicate, remove parasites, or simply play.
The long pectoral fins of humpback whales are among the longest limbs in the animal kingdom. In adults, they can grow several meters long.
When a huge whale falls back into the ocean, it creates an enormous splash that can be seen from far away.
