Did you know that...?

IQcoloring.com

When a common octopus feels threatened, it can release a cloud of ink. This helps confuse predators and gives the octopus time to escape.
An octopus's ink is not always pure black. In the common octopus, it is usually dark brown to blackish-brown and quickly spreads through the water.
After releasing its ink, the octopus can quickly jet away by pushing water through its siphon, allowing it to escape to safety.
The ink is not used to attack other animals. It is a clever defense that helps the octopus avoid danger and stay safe.
