Did you know that...?

Shore crabs often hide beneath rocks and inside small crevices, where they are protected from predators and strong waves.
Their hard shell acts like natural armor, but as they grow, they must shed it and form a new, larger one.
Crabs usually walk sideways because their legs are specially adapted for this unique way of moving.
They use their claws to collect food, carry it to their mouths, and protect themselves from danger.
Along the seashore, crabs help keep nature healthy by feeding on plant remains and small animals.
