Did you know that...?

IQcoloring.com

Sea stars usually have five arms, but some species can have many more. Each arm helps them move and search for food.
Several sea stars often live close together on rocky seabeds. Each one slowly searches for food among rocks, mussels and seaweed.
Sea stars do not have a brain or blood like humans. They move using hundreds of tiny tube feet located on the underside of their arms.
Mussels are a favorite food of many sea stars. They can slowly pull open tightly closed shells to reach the animal inside.
