Did you know that...?

Seahorses can hide surprisingly well among seaweed and other marine plants, where their unusual shape helps them blend into their surroundings.
Their prehensile tail works like a small gripping tool, allowing them to wrap securely around seaweed stems and avoid being swept away by water currents.
By holding onto a plant, a seahorse can remain in one place while searching for tiny prey, which it catches with its long snout.
Even among the seaweed, however, a seahorse must remain alert because predators may be nearby looking for small prey.
