Did you know that...? Seahorses hunt tiny crustaceans and other small animals, which they quickly suck in through their long tubular snout. They have no teeth, so they do not bite or chew their food but swallow their prey whole. When hunting, a seahorse slowly approaches its prey and then uses a rapid suction of water to draw it directly into its mouth. Seahorses also lack a true stomach, so food passes through their digestive system relatively quickly and they need to feed frequently throughout the day.
