Did you know that...?

The tawny owl is a medium-sized European owl with a rounded head, no prominent ear tufts, large dark eyes, and a distinctive nighttime hoot.
Tawny owls often use natural cavities in old trees as safe places for nesting and raising their young.
Old trees with natural cavities are therefore very important habitats for tawny owls and many other woodland animals.
The chicks remain sheltered inside the hollow for a time, where they are protected from bad weather and many dangers in the surrounding forest.
Adult tawny owls care for their chicks, watch over the nesting area, and regularly bring them food.
The tawny owl gives a wavering, rhythmic "hoo-hooo" call, often using it to announce its territory to other owls in the forest.
