Did you know that...?

Bald eagles are often found near lakes, rivers, and coastlines because fish are an important part of their diet.

When hunting, a bald eagle can fly low over the water and grab a fish near the surface with its powerful talons without fully diving into the water.

Its long, curved claws help it grip slippery fish firmly as it lifts them from the water.

Adult bald eagles are easy to recognize by their striking white head and white tail, while young birds remain mostly dark for several years.

Despite its name, the bald eagle is not actually bald — the word "bald" originally referred to its conspicuously white head.
