Did you know that...?

The white-tailed eagle is one of Europe's largest birds of prey, with an impressive wingspan that can exceed two meters.
These powerful eagles build enormous nests from sturdy branches, usually high in old trees where their chicks can grow in relative safety.
An eagle's nest can grow to more than two meters across and weigh hundreds of kilograms because the birds often reuse it and add new branches year after year.
Both parents care for their chicks, bringing them food such as fish, waterbirds, and small mammals.
The young eagles remain in the nest for approximately two to three months before they become strong enough to take their first flights.
