Did you know that...?

The harpy eagle is one of the most powerful birds of prey in the world and lives in the tropical rainforests of Central and South America.
Unlike eagles that soar above open landscapes, the harpy eagle has relatively short, broad, and rounded wings that help it fly skillfully between trees in dense rainforests.
Its long tail helps it maintain balance and change direction while maneuvering through branches.
The harpy eagle has exceptionally strong legs and enormous curved talons, allowing it to catch relatively large animals living in the treetops, such as sloths and monkeys.
Its head features a distinctive crest of long feathers that it can raise, making this majestic bird of prey easy to recognize.
