Did you know that...?

The Philippine eagle is one of the largest and rarest birds of prey in the world and lives in the wild only in the Philippines, where it inhabits vast tropical rainforests. Its head features a distinctive crest of long feathers that it can raise, sometimes making it look as though it has a shaggy mane.

With its massive hooked beak and powerful talons, the Philippine eagle can hunt relatively large animals, including monkeys, Philippine flying lemurs, and other mammals living in the treetops.

Philippine eagles reproduce very slowly — the female usually lays just one egg, and both parents care for their chick for many months, even after it leaves the nest.

The Philippine eagle is critically endangered, mainly because of habitat loss, making the protection of large rainforests and mature trees essential for its survival.
