Did you know that...?

Southern rockhopper penguins live along the rocky coastlines of islands in the Southern Hemisphere, including the Falkland Islands, where they skillfully move by making short hops from rock to rock.
When searching for food, rockhopper penguins often leap directly from rocky shores into the ocean, where they become fast and agile swimmers.
Although rockhopper penguins cannot fly, their wings are adapted for swimming and work like powerful flippers, allowing them to move efficiently underwater.
Southern rockhopper penguins are easily recognized by their distinctive yellow feather crests above the eyes, red eyes, and strong orange-red beaks.
Underwater, rockhopper penguins mainly hunt krill, small fish, and squid, holding their breath while diving beneath the ocean surface in search of food.
