

Did you know that...?

Tractors help farmers mow large meadows much faster than they could by hand.
Freshly cut grass can be dried into hay, which is used to feed cows, horses, and other farm animals.
During mowing, farmers must also watch out for wild animals, such as young deer, that may be hiding in the tall grass.
Storks often search for food in meadows and fields, where they can find insects, worms, and small frogs.
Freshly cut grass helps them because it makes it easier to spot food on the ground.
Tractors and mowers can sometimes indirectly help storks find something tasty to eat.
